HYBRID & ELECTRIC TECHNOLOGY

drive with us
Transfluid

Founded in Milan Italy in 1957, Transfluid has always been a point of reference in the world of industrial transmission equipment and the standard that its competitors measure themselves.

Fluid couplings, variable speed drives, brakes, clutches, couplings and hydraulic transmissions constitute the core of the product line, while ultra-modern technology, careful selection of materials and meticulous assembly are the key ingredients in the recipe that has placed those products at the forefront of the market. Thousands of customers continue to choose Transfluid for the most diverse and demanding applications, knowing they can rely on Transfluid’s technical department, where design, engineering and planning experts are always on hand to quickly resolve client’s problems.

Italian dynamic innovation, coupled with ongoing staff development and more than fifty years of hard-earned expertise, are the foundation of the company’s success. Transfluid’s unique approach has sparked small but important revolutions in the field of heavy-duty transmissions, for which recognition has come in the form of international awards. Transfluid’s catalogue boasts a wide range of products, and each unit produced is tested for safety, quality and durability. Being a world leader in the design and manufacture of fluid couplings, Transfluid has earned a reputation for diligent service, which assures the competence of the applications through careful quality control and on-site technical assistance. In addition to the Italian Headquarter, Transfluid’s broad sales network consists of six branches located in China, France, Germany, Netherlands, Russia and United States and 32 distributors located throughout the world.

Transfluid’s Hybrid

The industrial market has been focused on developing new technologies to reduce their ecological impact on land and sea. Global awareness of air, noise and water pollution attributed to internal combustion engines has caused vehicle manufacturers to invest large amounts of money and resources into developing hybrid systems used in automobiles and small commercial vehicles. However, because of the wide variety of drive line designs used in industrial and marine markets, a standardized, quality, heavy duty “hybrid product” has been impractical to develop.

Accepting the challenge to provide a hybrid product for this neglected market Transfluid is ready to introduce a solution for low to medium power marine and industrial applications. For decades Transfluid has been manufacturing a wide range of power transmission equipments and electric motors/generators. Profiting from their experience in thousands of industrial and marine applications and using their existing technology it resulted in the development of the technology of the future.

The System

The hybrid system works in three specific modes:

- **electric propulsion** to drive or sail at ZERO emissions and in absolute silence
- **engine propulsion** that uses the electric machine as generator to recharge the batteries
- **“booster” function** that allows the electric motor, during acceleration, to assist the engine in providing extra torque to the driveline

How It Works

The input side is a hydraulic or pneumatic controlled clutch. When disengaged, the engine is disconnected from the rest of the driveline allowing the vehicle or vessel to be operated by the electric motor instead of the engine. During engine operation, the clutch is engaged and the electric motor becomes a generator, recharging the batteries, if required. By operating the engine and electric motor at the same time, the “booster” operation is engaged, increasing the total available power to the driven machine. All operations are controlled via Transfluid’s proprietary electronic controller MPCB-R5, which communicates with all equipements through CAN BUS protocol, making the system a simple “plug and play” solution.
**HTV700**

- Split power drive drive with SAE B pto
- SAE standard dry clutch, operated by solenoid valve, to connect and disconnect internal combustion engine
- Clutch actuation solenoid valve
- Three speed forward, one speed reverse Powershift Transmission
- Drop box for 2 or 4 wheel drive, available with wide variety of reduction ratios

**HM560 with Hydrostatic Transmission**

- Split power drive drive with SAE B pto
- SAE standard dry clutch, operated by solenoid valve, to connect and disconnect internal combustion engine
- Clutch actuation solenoid valve
- Hydraulic Pump
- Single Pump drive

**Working scheme**

- Electric machine that can operate as electric motor or electric generator
- Electric selector control unit with integrated soft shift ability
- Drop box installation with 6 different inclination angle positions
- Spring loaded wet discs parking brake, operated by solenoid valve

**Legend**

- Red: Power Wire
- Green: Can Wire
- Black: Digital Wire
**Marine hybrid**

**HTM700**
- Split power drive with SAE B pto
- Electric machine that can operate as electric motor or electric generator
- SAE standard dry Clutch, operated by solenoid valve, to connect and disconnect internal combustion engine
- Clutch actuation solenoid valve
- Forward-Reverse Powershift marine gear

**HM560 with Cardan Shaft**
- Split power drive with SAE B pto
- Electric machine that can operate as electric motor or electric generator
- SAE standard dry Clutch, operated by solenoid valve, to connect and disconnect internal combustion engine
- Clutch actuation solenoid valve
- Cardan shaft

**Working scheme**
- Electric machine that can operate as electric motor or electric generator
- Electric selector with integrated Soft-Shift ability
- Electric machine that can operate as electric motor or electric generator
- Working scheme

**Legend**
- POWER WIRE
- CAN WIRE
The hybrid series

In close cooperation with leading battery and motorcontroller manufacturers the HM Module series (560-2000-3350-6300) was developed to provide a standard, simple, quality solution. Designed to “sandwich” between an engine with a SAE flywheel and housing and transmission with a SAE input, the HM module provides a seamless solution that is easier to apply and simpler to operate than any application specific solution. Additionally, the electric machine (the motor generator) can be mounted in multiple positions in order to provide the best fit for the engine compartment. To install, all that is required is a short distance between the engine and transmission, this make it an ideal solution for retrofits and new designs.

Transfluid also provides two packages that couple the HM technology with their power shift transmissions and marine products. The HTV700 is a complete vehicle transmission product utilizing a power shift transmission, 4wd drop box and brake. Designed to be exceptionally compact it is ideal for ground support equipment and small mining and construction machines. The HTM700 is a hybrid marine transmission. The electric function is becoming mandatory in many ports where they are trying to mitigate the air and water pollution caused by tendering and docking vessels. The HTV700 is applicable for engines up to 95 kW (127 hp) while the HTM700 is capable of 140 kW (187 hp). Both Packages are equipped with a come home feature.

Reference catalogs of the products we use in hybrid & electric technology
By dedicating significant resources in the research and development of the Hybrid System range of products Transfluid is capable of providing complete hybrid solutions as well as the technical support required by manufacturers to implement these products. Transfluid’s Hybrid System easily integrates into traditional propulsion systems assuring an efficient solution to green power and fuel economy.

All modules fit between the engine and transmission, occupying limited space, as though they are an integrated and independent component in the propulsion driveline.

Not only the ecological sustainability is one of the advantages of Hybrid solutions but fuel savings and energy management are of the same importance. With the “booster” function, designers can consider a lower power engine yet still maintain the desired performances.

Ship owners can retrofit their vessels thereby providing lower costs and profiting from immediate benefits.

Transfluid is not just a supplier, but also a partner. By providing innovative technology coupled with competitive pricing, even the most difficult hybrid problems can be quickly solved.

(1) SAE J620: different Input or Output connections available upon request
(2) Without drop box & brake
(3) With cooler
(4) DIN 120 and SAE 1410 available
(5) BW 6-5” available
Electric Propulsion System

The EPS (ELECTRIC PROPULSION SYSTEM) provides innovative electric propulsion through the combination of standard Transfluid products. Integrating standard components and adhering to SAE standards produces a new product which easily interfaces with any user and application. When used with commercial vehicles, the EPS system includes an automatic “Powershift” RANGERMATIC or REVERMATIC transmission. For marine propulsion the REVERMATIC marine gear uses the reliable RBD coupling. Both transmissions can be installed with Transfluid’s permanent magnets electric motor. This improves the operations of the vehicle or boat by using the efficiency and performance of the electrical machine.

The innovative concept of EPS consists of an automatic RANGERMATIC “Powershift” transmission coupled to a permanent magnet electric motor. This optimizes the driving experience of the vehicle and enhances the performance of the motor. The RANGERMATIC reduction ratios allow the user to select the optimal ratio according to the operating conditions. The addition of the DROP BOX DP280 on the output of the EPS system provides additional gear ratios to enhance the electric motor performances. Additionally, the drop box is available with two outputs for four-wheel drive applications. This provides identical use and driving of the EPS system to those of a combustion engine. The use of batteries, indispensable for the supply of the electric machines, allows the recovery of kinetic energy during deceleration and braking (Kinetic Energy Recovery System) storing energy that would otherwise be lost, increasing the autonomy of the vehicle.
